03 / ER diagram

Core persisted domain; selected fields. PK = primary key, UK = unique key, REF = logical reference (not a declared foreign key)

Schema prefixes abbreviate railway_<service>_db; user = railway_user_db, reservation = railway_reservation_db, etc.
Omitted supporting tables: OTP/invitations, train days/class enum collections, cancelled runs, user notifications, booking outbox, webhook and delivery logs.
Service ownership is preserved. Invariants such as a published route having at least two stops are validated in services, not guaranteed by every FK.

Source: entity mappings across the eight persistence services. Foreign-key annotations and scalar references are deliberately distinguished.
